

TASK 28

AGENTIC AI PROBLEM STATEMENT

TalentScout AI: Autonomous Recruitment Intelligence and Candidate Ranking System

Recruitment is a time-consuming and fragmented process where recruiters manually search for candidates across multiple platforms, filter profiles based on skills, compare experience, and create shortlists. This often leads to delays in hiring, inconsistent evaluation, and the possibility of missing highly suitable candidates, especially when multiple job roles need to be managed simultaneously.

There is a need for an intelligent automated system that can understand job requirements, search and collect candidate profiles from multiple sources, and structure unorganized data into a usable format. The system should also be capable of analyzing skill relevance, comparing experience levels, and ranking candidates based on suitability for a given role.

TalentScout AI is an Agentic AI-based recruitment automation system that addresses this problem by converting the hiring process into an end-to-end intelligent workflow. It takes job role, skills, and experience as input through a form, then automatically discovers candidates, evaluates and scores them, ranks the best profiles, and generates a structured report. The final output is stored in Google Sheets or sent to recruiters via email or messaging platforms, enabling faster, more accurate, and fully automated recruitment decisions.
